WINGED WONDERS
by Meeg Pincus

For decades, as the monarch butterflies swooped through every year like clockwork, people from Canada to the United States to Mexico wondered, "Where do they go?" In 1976 the world learned the answer: after migrating thousands of miles, the monarchs roost by the millions in an oyamel grove in Central Mexico’s mountains. But who solved this mystery? Was it the scientist or the American adventurer? The citizen scientists or the teacher or his students?

Fun Facts:

- Monarchs have a wingspan of approximately 4 inches and an average weight of about half a gram – about the weight of a paper clip!
- Monarchs range from Canada to Mexico depending on the time of the year.
- Milkweed plants are the only source of food for the monarch caterpillar.
- Butterfly wings are densely covered with scales that improve their aerodynamic efficiency. The upper surface of the thorax is covered with long hair-like scales that help retain heat.
